

# Climate change Roundtable

## Summative Reflection

2026-05-04T03:08:15Z

2026-05-04T

1) Interpret the different perspectives about climate change

a) IPCC head

→ Climate Change is a pressing issue that is affecting everyone, and we must take action to prevent it.

• Amazon Native

→ Climate change is ruining their lives, culture, home, and history, as the ~~rising temperatures~~<sup>deforestation</sup> forces them to migrate.

• Antarctic scientist

→ climate ~~change~~<sup>change</sup> is a real issue that ~~we~~<sup>they</sup> can see — they see ice ~~ice~~ shelves collapsing and ~~coast~~ coastlines shrinking.

• Indian government representative

→ Coastal cities like Mumbai are struggling to keep up with the rising sea, and some cities that do not get any kind of precipitation are having ~~extreme~~ <sup>harsh</sup> heat.

2) Evaluate the various proposed solutions and identify which one shall be the most effective ~~at~~ in managing climate change.

a) The proposed solutions are:

• IPCC head → accelerate renewable energy use to reduce carbon GHG emissions and transition to a modern society

• Amazon native → give the indigenous people total control over the Amazon, as it is theirs and they should preserve it.

• Antarctic scientist → dump iron into the ocean to fertilize and stimulate phytoplankton in the sea, increasing the rate of carbon absorption

→ Indian representative

→ increase afforestation: for every tree cut, 2 new trees must be planted. Also, make this a religion law.

Flaws:

→ IPCC: too generic and that's what we've been trying to do, but nothing is happening.

→ Amazon native: giving the indigenous people total control over the Amazon rainforest would be sub-optimal as everyone needs the Amazon. Also, if ~~say~~ the natives decide to industrialize, they shall probably destroy it too.

→ Antarctic scientist: chance of causing a global winter due to lots of iron in the sea. Can also accelerate climate change if too much Fe is added.

→ Indian Rep: increasing afforestation could help in cleaning up the earth, but still, growing trees takes time.

Final verdict

The IPCC head's solution is the most viable <sup>is</sup> because. Although it's generic, it's quite a stable and ~~well-tested~~ well-modelled technique to reduce global emissions, and ~~it's not~~ it does not have many downsides besides things like cost and raw material extraction.
